

# Impact of climate variability on wheat production in central Nepal

Climate change is real and underway, so there is a need of economic assessment of impact of climate change on crop production and proper identification of adoption and mitigation measures. Lack of knowledge on climate change and its impacts on their farming system as well as weak Institutional supports to cope such impacts and poor knowledge on livelihood diversification is threatening farming communities. Climate change and agriculture are inextricably linked. Agriculture still fundamentally depends on the climatic condition and its impact on wheat production is of paramount importance for world food security.
