

Radioastronomy and radar

This book gives a short account of a new science which is revolutionizing our conception of the universe. The development of radio has provided a new means, in addition to the optical telescope of probing into the depths and distances of space, and learning more of what our universe is like. The use of radio for exploring the universe, or radioastronomy, has already revealed many things which cannot be seen by visible light, and will probably reveal regions of the universe so far away that they can never be seen by the agency of light.
